

# Ring-down Box

## Application of the ring-down box

You can measure the finesse of a resonator with the ring-down box **without** locking the resonator!

### Advantages

1. super fast (see characterization)
2. without locking the resonator

### Measurement Method

### Evaluation

Use this formula to analyse the datapoints:  
 $y(x)=A \cdot \exp(-x/t) + y_0$  with  $x :=$  time,  $t :=$  delay time

Afterwards calculate the finesse with  $F = 2\pi \cdot t \cdot FSR$  with  $FSR :=$  free spectral range.

### Electronic setup

- Electronic drawing (PDF-file)

### Explanation of the operating principle

Bilder rein mit dem Kurbven etc.

## List of components

- “flipflop” (datasheet)
