## General

Product data applies under the following conditions:

- Three hours storage at ambient temperature followed by 30 minutes warm-up operation
- Specified environmental conditions met
- Recommended calibration interval adhered to
- All internal automatic adjustments performed, if applicable

## Specifications with limits

Represent warranted product performance by means of a range of values for the specified parameter. These specifications are marked with limiting symbols such as  $<$ ,  $\leq$ ,  $>$ ,  $\geq$ ,  $\pm$ , or descriptions such as maximum, limit of, minimum. Compliance is ensured by testing or is derived from the design. Test limits are narrowed by guard bands to take into account measurement uncertainties, drift and aging, if applicable.

## Specifications without limits

Represent warranted product performance for the specified parameter. These specifications are not specially marked and represent values with no or negligible deviations from the given value (e.g. dimensions or resolution of a setting parameter). Compliance is ensured by design.

## Typical data (typ.)

Characterizes product performance by means of representative information for the given parameter. When marked with  $<$ ,  $>$  or as a range, it represents the performance met by approximately 80 % of the instruments at production time. Otherwise, it represents the mean value.

## Nominal values (nom.)

Characterize product performance by means of a representative value for the given parameter (e.g. nominal impedance). In contrast to typical data, a statistical evaluation does not take place and the parameter is not tested during production.

## Measured values (meas.)

Characterize expected product performance by means of measurement results gained from individual samples.

## Uncertainties

Represent limits of measurement uncertainty for a given measurand. Uncertainty is defined with a coverage factor of 2 and has been calculated in line with the rules of the Guide to the Expression of Uncertainty in Measurement (GUM), taking into account environmental conditions, aging, wear and tear.

Device settings and GUI parameters are indicated as follows: "parameter: value".

Typical data as well as nominal and measured values are not warranted by Rohde & Schwarz.

## Phase noise sensitivity without R&S®FSWP-B60/R&S®FSWP-B61 option

Start offset 1 Hz, correlation factor = 1, frequency reference internal, signal level  $\geq 10$  dBm, without R&S®FSWP-B4 option.  
Specified values in dBc (1 Hz). For typical values subtract 6 dB.

50 GHz	-20	-48	-76	-101	-113	-116	-123	-143	-146

R&S®FSWP-B4 option improves the phase noise sensitivity at 1 Hz offset by 10 dB (nom.). At other offsets the above specification applies.

<sup>1</sup> Without R&S®FSWP-B60 / R&S®FSWP-B61 option the impact of cross correlation is limited by the residual phase noise of the R&S®FSWP local oscillators (1 set only). Therefore the phase noise does not improve with increasing number of correlations as indicated in this table. Instead the specifications indicated in section Phase noise sensitivity without R&S®FSWP-B60 option apply.

## Measurement speed, nominal values

The measurement times in the table below apply to the following conditions:  
auto freq = off, correlation factor set to ≥10, measurement times normalized to correlation factor = 1.

Span	Bandwidth in % of offset		
	30 %	10 %	3 %
1 Hz to 1 MHz	7 s	8 s	25 s
1 kHz to 1 MHz	0.03 s	0.04 s	0.07 s

To obtain the measurement time for a given number of correlations (without automatic signal frequency search), multiply the above figures by the number of correlations.
